Scientists continue to improve these methods to provide more detailed diagnostic information. Researchers and doctors use a variety of imaging and chemical and metabolic tests techniques to detect, manage and treat neurological diseases. Many tests can be performed in a doctor's office or in an outpatient test center, with little or no risk to the person. Some procedures are performed in specialized environments to determine particular disorders or abnormalities. Depending on the type of test, results can be immediate or may take time to process. top What is a neurological examination? The neurological examination of A evaluates motor and sensory abilities, hearing and speech, vision, coordination and balance. You can also test the mental state, mood and behavior. The test uses tools such as a fork, flashlight, reflex hammer and a tool to examine the eye. The results of the neurological examination and the patient's history are used to determine a list of possibilities, known as differential diagnosis, that help determine which additional diagnostic tests and procedures are needed. Top What are some of the most common screening tests? Blood, urine, or other body fluid screening tests can help doctors diagnose diseases, understand the severity of the disease and monitor the levels of therapeutic drugs. Certain tests, ordered by the doctor as part of a regular checkup, provide general information, while others are used to identify specific health concerns.
